Claims

- Method for producing rhenium-188 labeled particles in which particles of an organic polymer or a biopolymer are suspended in a solution and heated to 80 °C to 100 °C, wherein the solution has initially a pH value of pH 1 to pH 3 and comprises:
 - a) a water-soluble tin-II salt,

- b) a Re-188 perrhenate salt with a radioactivity of 1,000 MBq to 60,000 MBq, characterized in that after 45 minutes to 70 minutes of heating the pH value is increased and adjusted to a pH value of pH 5 to pH 8.5.
- 2. Method according to claim 1, characterized in that for increasing the pH value a solution of citrate, acetate, or tartrate, preferably potassium sodium tartrate, is used.
- 3. Method according to one of the claims 1 or 2, characterized in that the solution contains a complexing agent for stabilizing the tin-II salt, selected from 2, 5-dihydroxy benzoic acid, acetic acid, citric acid, malonic acid, gluconic acid, lactic acid, hydroxy isobutyric acid, ascorbic acid, tartaric acid, succinic acid, the salts of the aforementioned acids or glucoheptonate.
- 4. Method according to claim 3, characterized in that 2,5-dihydroxy benzoic acid is used as the complexing agent for stabilizing the tin-II salt.
- 5. Method according to one of the claims 1 to 4, characterized in that the particles have a diameter of 10 μm to 30 μm.
 - 6. Method according to one of the claims 1 to 5, characterized in that the water-soluble tin-II salt at the beginning of the method is present in the solution in a concentration of 10 mmol/I to 50 mmol/I.

- 7. Method according to one of the claims 1 to 6, characterized in that the particles are comprised of human serum albumin.
- 8. Pharmaceutical kit for producing particles labeled with Re-188, comprising:
 - a) a first container with a quantity of water soluble tin-II salt and a quantity of a complexing agent for stabilizing the tin-II salt, selected from 2, 5-dihydroxy benzoic acid, acetic acid, citric acid, malonic acid, gluconic acid, lactic acid, hydroxy isobutyric acid, ascorbic acid, tartaric acid, succinic acid, the salts of the aforementioned acids or glucoheptonate;
 - a second container with particles made from an organic polymer or a biopolymer;
 - c) a third container with a quantity of a substance for increasing the pH value, selected from citrate, acetate, or tartrate, present in solid form or in aqueous solution and generating in solution a pH value of pH 6.5 to pH 8.5.
- 9. Pharmaceutical kit according to claim 8, characterized in that 2,5-dihydroxy benzoic acid is the complexing agent for stabilizing the tin-II salt.
- 10. Pharmaceutical kit according to claim 8 or 9, characterized in that the substance for increasing the pH value is potassium sodium tartrate.
- 11. Pharmaceutical kit according to one of the claims 8 to 10, characterized in that the particles have a diameter of 10 μm to 30 μm .
- 12. Pharmaceutical kit according to one of the daims 8 to 11, characterized in that the kit contains 0.02 mmol to 0.1 mmol tin-II salt per administration to the patient.

- 13. Pharmaceutical kit according to one of the claims 8 to 12, characterized in that the particles are comprised of human serum albumin.
- 14. Rhenium-188 labeled particles produced by the method according to one of the claims 1 to 6.

5

15. Use of rhenium-188 labeled particles according to claim 14 for radiotherapy of tumors, carcinoma or their metastases.
